

SafeMetrics

SafeMetrics, LLC – Indoor Air Quality for Medical Facilities

A hospital, surgery center or other medical facility serves vulnerable populations where the safety and hygiene status of their treatment facility should not increase their risk of a healthful outcome.

Indoor Air Quality Monitoring

Medical facilities are responsible for providing a safe and healthful environment for different populations including patients, staff, families, visitors and vendors. The air quality of your facility is a necessity, but can the safety status of a procedure or activity be verified by a measured, environmental outcome?

Air monitoring can provide that data enabling you to take decisive, corrective actions. Whether its data to determine the impact of mold removal on a wall adjacent to a neonatal unit or if verifying housekeeping procedures in post op is required. We are trained to find what you can't see. You can then make aggressive infection control decisions with actual data, not a hypothesis. Your results are analytical, not subjective. And defensible.

We use state of the art equipment combined with our customized sampling strategies to evaluate conditions unique to your facility. Combining these resources with traditional practice control methods provides the most complete and timely information when its needed most.

WBE-Certified Company (WBE)

Diversity requirements are becoming more common in today's business environment. Our certification as a Woman-Owned Business Enterprise (WBE) can assist you as a business owner, Construction manager, Contractor and Subcontractor in satisfying specific bid requirements.

Air Monitoring Capabilities

We are equipped to perform sampling for a variety of IAQ conditions including:

- Patient impacts of repair, renovation or construction activities;
- Surface contamination issues associated with laundry, chemical, medical waste or biological residue;
- Verification of viable air and surface contamination for USP 797;
- Nosocomial infections related to Legionella species, fecal coliform or MRSA.

Development of Monitoring Programs

Today's regulatory environment including OSHA and JACHO certifications routinely require evaluations of workplaces and specific processes. If potential problems exist, they must be controlled in a manner that is effective, cost-efficient, and in compliance with applicable regulations. We support your goals by offering a variety of professional monitoring services including OSHA baseline and periodic monitoring, verification monitoring for compliance activities, medical surveillance monitoring, respirator fit testing, water testing, expert witness support as well as full or part-time support of existing IH programs.
