

Industrial Hygiene

SafeMetrics, LLC – Industrial Hygiene Services

Poor air quality leads to employee complaints, occupational disease and long term implications on an individual's health. By managing these conditions immediately, you will truly have a safer business environment.

Industrial Hygiene Monitoring

Industrial hygienists analyze, identify, and measure workplace hazards or contaminants which can be chemical, physical, ergonomic or biological in nature. These contaminants become air borne during production or construction projects and can impact a variety of individuals including employees, occupants, patients and even the general public.

The ability to collect analytical data on chemicals is of increasing importance to the health and welfare of your employees. The use of state of the art equipment combined with our customized sampling strategies is the key to determining the likely cause. Use of electronic media and on line databases allows us to remain abreast of the most recent regulatory changes, research, and test procedures. Combining these resources with traditional sampling methods provides the most complete and timely information when it's needed most.

WBE-Certified Company (WBE)

Diversity requirements are becoming more common in today's business environment. Our certification as a Woman-Owned Business Enterprise (WBE) can assist you as a business owner, Construction manager, Contractor and Subcontractor in satisfying specific bid requirements. Ask us how we can help you exceed these diversity thresholds.

Air Monitoring Capabilities

We are equipped to perform air sampling for nearly all classes of chemical contaminants including asbestos, toxic metals, noise, latex and indoor air contaminants. We offer both personnel and area air monitoring services, using both active and passive sampling techniques. Real-time monitoring is available for many contaminants. Laboratories accredited by the American Industrial Hygiene Association (AIHA) provide us with timely analytical services, giving clients confidence in the defensibility of the data.

Development of Occupational Programs

Today's regulatory environment, including OSHA and MSHA regulations, routinely requires baseline evaluations of workplaces and specific processes. If potential problems exist, they must be controlled in a manner that is effective, cost-efficient, and in compliance with applicable regulations. We offer a variety of professional monitoring services including OSHA baseline and periodic monitoring, verification monitoring for compliance activities, medical surveillance monitoring, respirator fit testing, expert witness support as well as full or part-time support of existing IH programs.
